SAP MM • S/4HANA 2023

Dead Stock Analysis Report

Custom SQVI Report with Transaction Code ZDEADSTK

Project – Training System

System	SAP S/4HANA 2023
Module	SAP MM / Inventory Management
Tool	SQVI + SE93 (T-code: ZDEADSTK)
Environment	SAP Training System (Demo)

Note: Developed in SAP Training System for demonstration and portfolio purposes.

1. Project Overview

Designed and implemented a custom SAP MM inventory analytics report to identify dead stock and slow-moving materials. The solution was built using SQVI (QuickViewer) by integrating stock, master data, and material movement history across four core database tables.

The report was deployed via a custom transaction code ZDEADSTK created through SE93, allowing end users to execute it directly without needing to navigate SQVI — making it accessible to warehouse and procurement teams with standard user access.

2. Business Requirement

Warehouse and procurement teams lacked a single report to monitor materials with stock on hand but low or no recent movement. Standard SAP transactions required multiple navigation steps and manual consolidation across tools to arrive at the same insight.

Dimension	Detail
Problem	No single report existed to surface materials with stock > 0 and no/low movement
Affected Teams	Warehouse operations and procurement
Current Workaround	Manual cross-referencing across MB52, MB51, and MM60
Impact	Excess stock going undetected; working capital tied up unnecessarily

3. Objectives

- Identify materials with current stock and old movement dates
- Detect slow-moving and dead stock inventory across plants
- Improve working capital utilisation
- Support disposal, transfer, or procurement reduction decisions
- Provide easy end-user execution through a custom transaction code

4. Scope

	Items
In Scope	Plant-level inventory visibility, storage location stock, material descriptions, movement dates/types, user execution via T-code
Out of Scope	Automatic disposal postings, forecasting, Fiori app development

5. Solution Overview

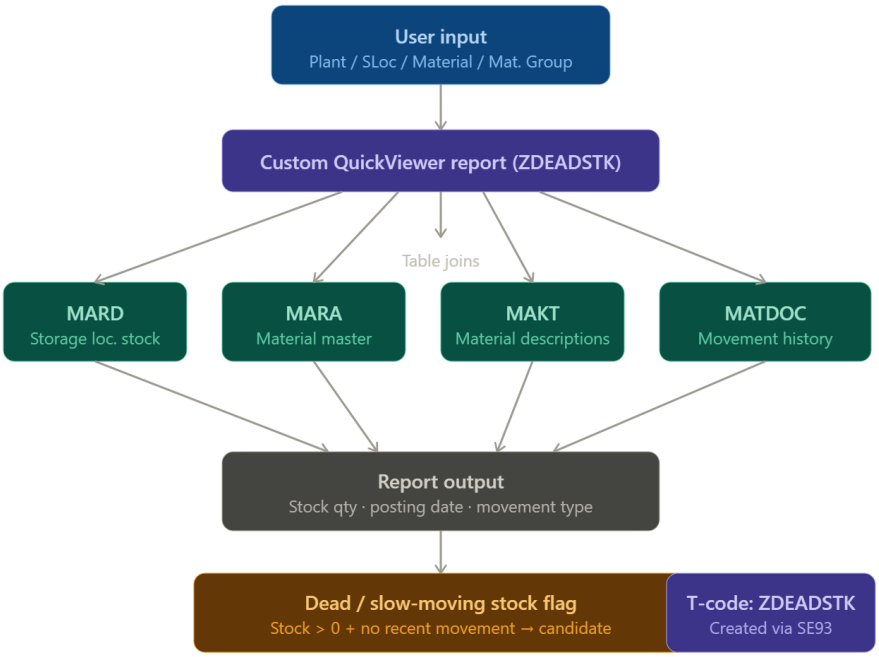
A custom QuickViewer report (SQVI query name: Z_DEAD_STOCK) was created by joining four database tables to provide a consolidated view of stock levels alongside material movement history:

Table	Name	Purpose
MARD	Storage Location Stock	Provides unrestricted stock quantity per plant/storage location
MARA	Material Master	Core material attributes and classification
MAKT	Material Descriptions	Language-dependent material text
MATDOC	Material Document	Material movement history with posting dates and movement types

A custom transaction code ZDEADSTK was then created in SE93, allowing users to launch the report directly without navigating through SQVI — eliminating an extra navigation step and reducing training requirements.

6. Functional Logic

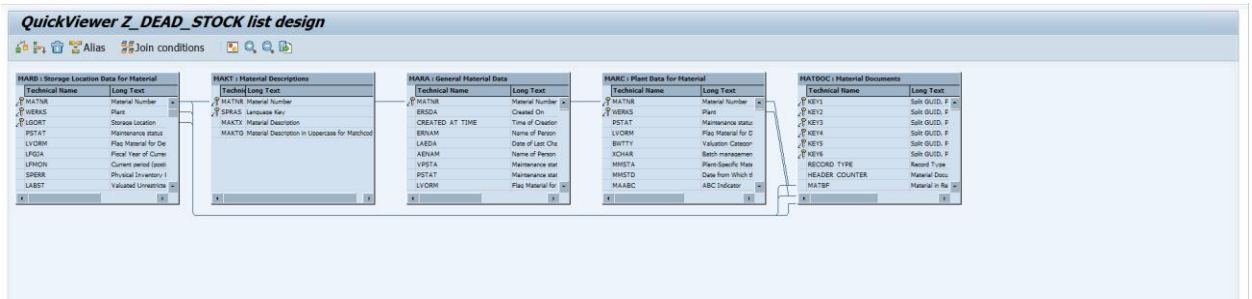
Step	Logic
1. Selection Input	User enters Plant, Storage Location, Material Number, and/or Material Group on the selection screen
2. Stock Retrieval	Report fetches unrestricted stock quantity from MARD for the entered criteria
3. Movement History	Posting date and movement type retrieved from MATDOC and displayed alongside stock data
4. Dead Stock Logic	Materials with stock > 0 and no recent movement are surfaced as candidates for slow-moving / dead stock review



7. Report Fields

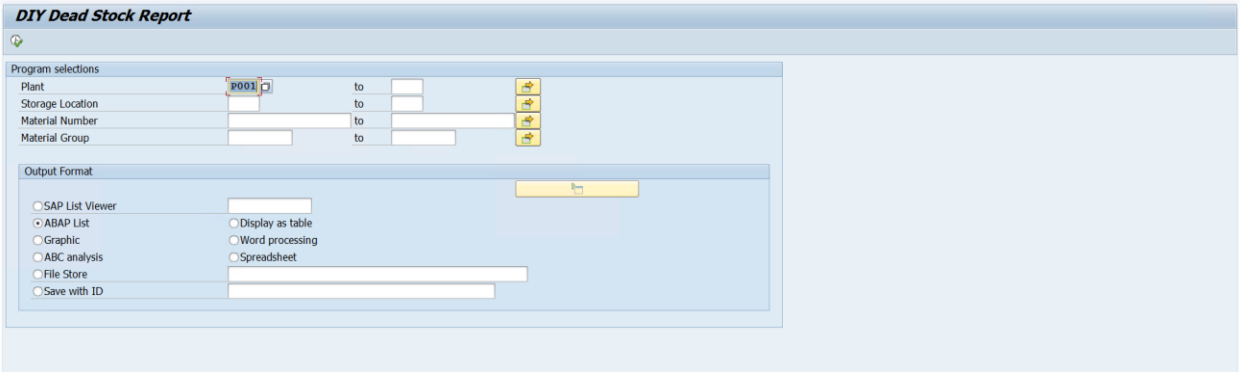
7.1 Selection Screen Fields

Field	Description
Plant	Filter by plant
Storage Location	Filter by storage location within the plant
Material Number	Restrict output to specific material(s)
Material Group	Filter by material group classification
Output Format	Display format selection for report output



7.2 Output Fields

Field	Source / Description
Material Number	MARD – unique material identifier
Plant	MARD – plant code
Storage Location	MARD – storage location within plant
Unrestricted Stock	MARD – available unrestricted stock quantity
Base Unit of Measure	MARA – base UOM for the material
Material Description	MAKT – language-dependent material text
Material Group	MARA – material group classification
Material Type	MARA – material type (e.g. ROH, FERT)
Movement Quantity	MATDOC – quantity from last movement
Posting Date	MATDOC – date of last material movement
Movement Type	MATDOC – type of last movement (e.g. 101, 261)



8. Business Benefits

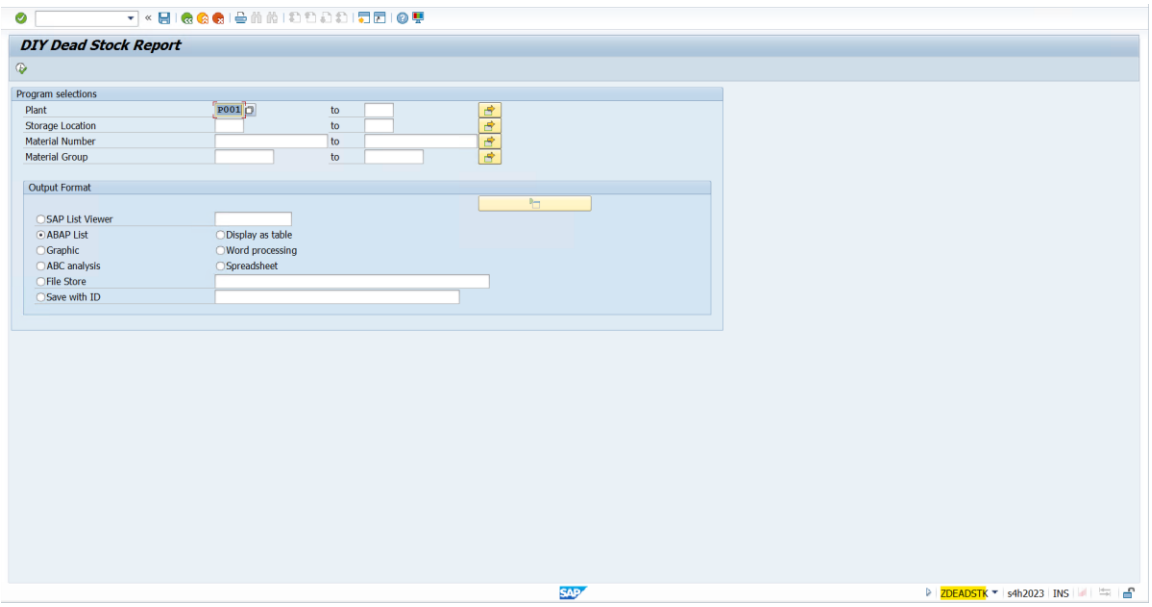
Benefit	Detail
Consolidated View	Replaces manual cross-referencing of MB52, MB51, and MM60 into one executable report
Working Capital	Reduces risk of excess stock going undetected, supporting better capital management
Faster Decisions	Enables warehouse and procurement teams to act on disposal, transfer, or reorder decisions quickly
Low Effort Build	Demonstrates practical SAP enhancement using standard tools — no development team required
Reusable Design	Built in under 2 hours; reusable across plants with minimal configuration change

9. Technical Artifacts

Artifact	Value
SQVI Query Name	Z_DEAD_STOCK
Transaction Code	ZDEADSTK
Created Via	SQVI + SE93
Tables Joined	MARD · MARA · MAKT · MATDOC
Authorization	Standard user access in training system

10. Testing & Validation

- Execute report for Plant P001 to confirm data retrieval across all fields
- Filter output by stock > 0 to isolate active stock positions
- Sort by oldest posting date to surface longest-idle materials
- Validate that materials with no recent movement are correctly flagged as dead stock candidates
- Verify custom transaction code ZDEADSTK launches the report directly without requiring SQVI navigation



DIY Dead Stock Report

Material	Plnt	Storage Location	Unrestricted	BUn	Material Description	Matl Group	MTyp	Quantity	BUn	Pstng Date	MvT

ZDEADSTK | s4h2023 | INS

✓ Validation Passed – Report executed successfully via ZDEADSTK; dead stock candidates surfaced correctly based on stock and movement date criteria.

Note: Developed and validated in an SAP Training System environment for demonstration and portfolio purposes only.
